

Designing a Seamless **Brand Identity** & **User Experience** for Print-tech + Design SaaS Platform

Role: Visual Designer & UX Support | Studio: Freelance Project | Industry: Print Technology

Context

Pressa was conceived as a web-based design and print platform where speed, simplicity, and quality converge. The platform serves small businesses and individuals in Kolkata, enabling them to order professionally printed materials — from business cards to large format prints — designed and delivered within 48 hours.

The objective went beyond building a functional website. The goal was to craft a complete brand ecosystem and user experience that could instil trust, communicate premium quality, and guide users from their first visit to a confirmed order — without friction.

Problem

Most print-on-demand platforms overwhelm users with complex configuration flows, unclear product hierarchies, and generic visual identities. This leads to high drop-off rates at the product selection and checkout stages, and erodes confidence in quality before the product is even seen.

For Pressa, the challenge was to design a platform that could:

- Communicate premium quality and speed without relying on heavy visuals
- Simplify a multi-path user journey (templates, uploads, or designer hire) without causing decision paralysis
- Build brand trust for a new entrant in a commoditised, price-sensitive market
- Convert first-time visitors into paying customers through clarity and confidence

The platform needed to feel like a professional design partner, not just another print vendor.

Research & Discovery

The design process began with research into the print services landscape, e-commerce UX patterns, and the expectations of Kolkata's small business community.

This included studying:

- Competitor platforms and their onboarding and ordering flows
- Drop-off patterns in multi-step e-commerce journeys
- Visual trust signals in service-based platforms
- How typography and colour influence perceived quality in B2B contexts
- AI-assisted design workflows and their integration into production pipelines

Key insight: Speed and trust must be communicated before the user takes a single action. The 48-hour promise is not just a logistics feature — it is the primary emotional hook and must be the first thing a visitor sees and believes.

Design Strategy

Pressa was built as a brand-first platform where every visual and UX decision reinforced its promise: fast, professional, delivered.

The strategy focused on three pillars:

1. Premium Brand Clarity — A clean, confident identity with disciplined colours, strong typography, and minimal imagery to avoid clutter.
2. Frictionless UX — Clear paths for three user types (template users, self-uploaders, designer-hire), all accessible from the homepage.
3. Conversion-Focused Design — Layouts, CTAs, and hierarchy optimized to reduce drop-offs and drive users from discovery to order.

Execution

Brand Identity & Visual Language

Developed a complete brand system including logo, brand kit, and brand guidelines. The identity uses a structured typographic hierarchy paired with a confident colour palette — warm neutrals grounded by an accent that communicates energy and reliability. The visual language is designed to scale consistently across digital, print, and product surfaces.

Website Design & Visual Assets

Created all website graphics, UI components, and visual assets in line with the brand system. Layouts were designed to communicate product range clearly, highlight key trust signal, and guide users toward conversion without overwhelming them with options.

Execution

UX Flow & User Journey Mapping

Mapped end-to-end user flows covering three primary paths: choosing a template, uploading a custom design, and hiring a designer. Navigation was structured to ensure a user can move from landing page to order confirmation in three steps or fewer, directly reducing friction and abandonment.

AI-Assisted Design Workflow

Integrated AI-assisted design processes into the production workflow, enabling faster iteration on visual assets and website components. This approach supported a leaner development cycle while maintaining design quality and brand consistency.

Outcome

- Established a premium, trust-first brand identity for a new market entrant
- Designed a clear, multi-path UX that reduces decision paralysis and supports diverse user types
- Delivered a 3-step order flow from landing to checkout confirmation
- Created a scalable brand and visual system ready for future product and market expansion
- Embedded AI-assisted workflows that reduced design production time without compromising quality

The final platform positioned Pressa not simply as a print vendor, but as a design-forward service partner for Kolkata's business community — built on the promise of quality, speed, and creative confidence.
